ECE 459 Winter 2021 1 / 33

Asynchronous I/O on linux

or: Welcome to hell.

(mirrored at compgeom.com/~piyush/teach/4531_06/project/hell.html)

"Asynchronous I/O, for example, is often infuriating."

— Robert Love. *Linux System Programming, 2nd ed,* page 215.

ECE 459 Winter 2021 2 / 33

Why non-blocking I/O?

Consider some I/O:

```
fd = open (...);
read (...);
close (fd);
```

Not very performant—under what conditions do we lose out?

ECE 459 Winter 2021 3 / 33

Mitigating I/O impact

So far: can use threads to mitigate latency. What are the disadvantages?

ECE 459 Winter 2021 4 / 33

Mitigating I/O impact

So far: can use threads to mitigate latency. What are the disadvantages?

- race conditions
- overhead/max # of thread limitations

ECE 459 Winter 2021 4 / 33

An Alternative to Threads

Asynchronous/nonblocking I/O.

```
fd = open(..., O_NONBLOCK);
read(...); // returns instantly!
close(fd);
```

• •

Not Quite So Easy

Doesn't work on files—they're always ready. Only e.g. sockets.

ECE 459 Winter 2021 6 / 33

Other Outstanding Problem with Nonblocking I/O

How do you know when I/O is ready to be queried?

ECE 459 Winter 2021 7 / 33

Other Outstanding Problem with Nonblocking I/O

How do you know when I/O is ready to be queried?

- polling (select, poll, epoll)
- interrupts (signals)

ECE 459 Winter 2021 7/33

Using epoll

Key idea: give epoll a bunch of file descriptors; wait for events to happen.

Steps:

- create an instance (epoll_create1);
- populate it with file descriptors (epoll_ctl);
- wait for events (epoll_wait).

ECE 459 Winter 2021 8 / 33

Creating an **epoll** instance

```
int epfd = epoll_create1(0);
```

efpd doesn't represent any files; use it to talk to epoll.

0 represents the flags (only flag: EPOLL_CL0EXEC).

ECE 459 Winter 2021 9 / 33

Populating the **epoll** instance

To add fd to the set of descriptors watched by epfd:

```
struct epoll_event event;
int ret;
event.data.fd = fd;
event.events = EPOLLIN | EPOLLOUT;
ret = epoll_ctl(epfd, EPOLL_CTL_ADD, fd, &event);
```

Can also modify and delete descriptors from epfd.

ECE 459 Winter 2021 10 / 33

Waiting on an **epoll** instance

Now we're ready to wait for events on any file descriptor in epfd.

```
#define MAX_EVENTS 64

struct epoll_event events[MAX_EVENTS];
int nr_events;

nr_events = epoll_wait(epfd, events, MAX_EVENTS, -1);
```

-1: wait potentially forever; otherwise, milliseconds to wait.

Upon return from epoll_wait, we have nr_events events ready.

ECE 459 Winter 2021 11 / 33

```
#define MAX EVENTS 10
struct epoll event ev, events[MAX EVENTS];
int listen sock, conn sock, nfds, epollfd:
/* Code to set up listening socket, 'listen sock',
   (socket(), bind(), listen()) omitted */
epollfd = epoll create1(0);
if (epollfd == -1) {
    perror("epoll create1");
    exit(EXIT FAILURE):
ev.events = EPOLLIN:
ev.data.fd = listen sock;
if (epoll ctl(epollfd, EPOLL CTL ADD, listen sock, &ev) == -1) {
    perror("epoll_ctl:\(\Omega\)isten_sock");
    exit(EXIT FAILURE);
```

ECE 459 Winter 2021 12 / 33

```
for (;;) {
    nfds = epoll_wait(epollfd, events, MAX_EVENTS, -1);
    if (nfds == -1) {
        perror("epoll wait"):
        exit(EXIT FAILURE);
    for (n = 0; n < nfds; ++n) {
        if (events[n].data.fd == listen_sock) {
           conn_sock = accept(listen_sock, (struct sockaddr *) &addr, &
                addrlen):
            if (conn sock == -1) {
               perror("accept");
                exit(EXIT FAILURE):
           setnonblocking (conn_sock);
           ev.events = EPOLLIN | EPOLLET;
           ev.data.fd = conn sock;
            if (epoll_ctl(epollfd, EPOLL_CTL_ADD, conn_sock,
                       &ev) == -1) {
               exit(EXIT FAILURE):
         else 🖯
           do_use_fd(events[n].data.fd);
```

Nonblocking I/O with curl

Similar idea to epoll:

- build up a set of descriptors;
- invoke the transfers and wait for them to finish;
- see how things went.

ECE 459 Winter 2021 14 / 33

Classic, Blocking cURL Request

Here's a simple cURL program that we can look over:

```
#include <stdio.h>
#include <curl/curl.h>
int main( int argc, char** argv ) {
  CURL *curl;
  CURLcode res:
  curl_global_init(CURL_GLOBAL_DEFAULT);
  curl = curl easy init();
  if ( curl ) {
    curl_easy_setopt(curl, CURLOPT_URL, "https://example.com/");
    res = curl easy perform ( curl );
  if ( res != CURLE OK ) {
      fprintf(stderr, "curl easy perform() \( \) failed: \( \) failed: \( \) \( \), curl easy strerror(
            res)):
    curl easy cleanup(curl):
  curl global cleanup():
  return 0;
```

curl_multi initialization

curl_multi: work with multiple resources at once.

 To use curl_multi, first create the individual requests (curl_easy_init).
 (Set options as needed on each handle).

2. Then, combine them with:

- curl_multi_init();
- curl_multi_add_handle().

ECE 459 Winter 2021 16/33

Start reqs: curl_multi_perform(CURLM* cm, int* still_running)

The second parameter is updated with the number of still-in-progress requests.

Meantime, we can do other things!

ECE 459 Winter 2021 17/33

I'm bored... So take a nap?

Suppose we've run out of things to do and nothing is ready yet. Wait!

```
curl_multi_wait( CURLM *multi_handle, struct curl_waitfd extra_fds[],
unsigned int extra_nfds, int timeout_ms, int *numfds )
```

This function will block the current thread until something happens.

Choose how long to wait and see how many events occurred.

ECE 459 Winter 2021 18 / 33

While You Were Sleeping

While we are asleep or doing other things, callbacks still happen.

The status of the cURL easy handle is updated.

ECE 459 Winter 2021 19 / 33

Knowing what happened after curl_multi_perform

curl_multi_info_read will tell you.

```
msg = curl_multi_info_read(multi_handle, &msgs_left);
```

and also how many messages are left.

```
msg->msg can be CURLMSG_DONE or an error;
msg->easy_handle tells you who is done.
```

Some gotchas (thanks Desiye Collier):

- Checking msg->msg == CURLMSG_DONE is not sufficient to ensure that a curl request actually happened. You also need to check data.result.
- (A1 hint:) To reset an individual handle in the multi_handle, you need to "replace" it. But you shouldn't use curl_easy_init(). In fact, you don't need a new handle at all.

ECE 459 Winter 2021 20 / 33

curl_multi cleanup

Call curl_multi_cleanup on the multi handle.

Then, call curl_easy_cleanup on each easy handle.

If you replace curl_easy_init by curl_global_init, then call curl_global_cleanup also.

ECE 459 Winter 2021 21 / 33

```
#include <stdio.h>
#include < stdlib .h>
#include <unistd h>
#include <curl/multi.h>
#define MAX WAIT MSECS 30*1000 /* Wait max. 30 seconds */
const char *urls[] = {
  "http://www.microsoft.com",
  "http://www.yahoo.com",
  "http://www.wikipedia.org",
  "http://slashdot.org"
#define CNT 4
size t cb(char *d, size t n, size t l, void *p) {
  /* take care of the data here, ignored in this example */
  return n*l;
```

ECE 459 Winter 2021 22 / 33

```
void init ( CURLM *cm. int i ) {
 CURL *eh = curl easy init();
  curl_easy_setopt( eh, CURLOPT_WRITEFUNCTION, cb );
  curl easy setopt( eh, CURLOPT_HEADER, OL );
  curl easy setopt( eh, CURLOPT URL, urls[i] );
  curl easy setopt(eh. CURLOPT PRIVATE, urls[i]):
  curl easy setopt (eh, CURLOPT VERBOSE, OL);
  curl multi add handle (cm, eh);
int main( int argc, char** argv ) {
   CURLM *cm = NULL:
   CURL *eh = NULL;
   CURLMsg *msg = NULL:
   CURLcode return code = 0;
    int still running = 0;
    int msgs_left = 0;
    int http status code;
    const char *szUrl:
    curl global init ( CURL GLOBAL ALL );
   cm = curl multi init():
    for ( int i = 0; i < CNT; ++ i ) {
        init (cm, i):
```

```
curl_multi_perform( cm, &still_running );

do {
    int numfds = 0;
    int res = curl_multi_wait( cm, NULL, 0, MAX_WAIT_MSECS, &numfds );
    if( res != CURLM_OK ) {
        fprintf( stderr, "error:\(\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\text{\tex
```

ECE 459 Winter 2021 24 / 33

```
while ( ( msg = curl_multi_info_read ( cm, &msgs_left ) ) ) {
               if ( msg->msg == CURLMSG DONE ) {
                            eh = msg->easy_handle;
                             return code = msg->data.result:
                             if ( return code != CURLE OK ) {
                                            fprintf( stderr, "CURLMerrorMcode: Mod\n", msg->data.result );
                                           curl_multi_remove_handle( cm, eh );
                                           curl easy cleanup (eh);
                                           continue:
                             http status code = 0: szUrl = NULL:
                             curl_easy_getinfo( eh, CURLINFO_RESPONSE_CODE, &http_status_code )

                              if( http status code == 200 ) {
                                            printf( "200\overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Overline{\Ove
                             } else {
                                            fprintf( stderr, "GETMofM%sMreturnedMhttpMstatusMcodeM%d\n",
                                                              szUrl. http status code ):
                             curl multi remove handle (cm. eh):
                             curl easy cleanup (eh):
               } else {
                             fprintf( stderr, "error: Mafter Mcurl_multi_info_read(), MCURLMsg=%d\
                                             n", msg->msg );
```

```
curl_multi_cleanup( cm );
curl_global_cleanup();
return 0;
}
```

Scaling This

The developer claims that you can have multiple thousands of connections in a single multi handle.

60k ought to be enough for anyone!

ECE 459 Winter 2021 27 / 33

cURL + select

ECE 459 Winter 2021 28 / 33

Process, Threads, AIO?! Four Choices

- Blocking I/O; 1 process per request.
- Blocking I/O; 1 thread per request.
- Asynchronous I/O, pool of threads, callbacks, each thread handles multiple connections.
- Nonblocking I/O, pool of threads, multiplexed with select/poll, event-driven, each thread handles multiple connections.

ECE 459 Winter 2021 29 / 33

Blocking I/O; 1 process per request

Old Apache model:

- Main thread waits for connections.
- Upon connect, forks off a new process, which completely handles the connection.
- Each I/O request is blocking:
 e.g. reads wait until more data arrives.

Advantage:

"Simple to understand and easy to program."

Disadvantage:

High overhead from starting 1000s of processes.
 (can somewhat mitigate with process pool).

Can handle \sim 10 000 processes, but doesn't generally scale.

ECE 459 Winter 2021 30 / 33

Blocking I/O; 1 thread per request

We know that threads are more lightweight than processes.

Same as 1 process per request, but less overhead.

I/O is the same—still blocking.

Advantage:

Still simple to understand and easy to program.

Disadvantages:

- Overhead still piles up, although less than processes.
- New complication: race conditions on shared data.

ECE 459 Winter 2021 31 / 33

Asynchronous I/O Benefits

In 2006, perf benefits of asynchronous I/O on lighttpd1:

version	-	fetches/sec	bytes/sec	CPU idle
1.4.13	sendfile	36.45	3.73e+06	16.43%
1.5.0	sendfile	40.51	4.14e+06	12.77%
1.5.0	linux-aio-sendfile	72.70	7.44e+06	46.11%

(Workload: 2×7200 RPM in RAID1, 1GB RAM, transferring 10GBytes on a 100MBit network).

I http://blog.lighttpd.net/articles/2006/11/12/lighty-1-5-0-and-linux-aio/ ECE 459 Winter 2021

Using Asynchronous I/O in Linux (select/poll)

Basic workflow:

- enqueue a request;
- 2 ... do something else;
- (if needed) periodically check whether request is done; and
- 4 read the return value.

ECE 459 Winter 2021 33 / 33
