Case Study: Firefox Quantum

ECE 459 Winter 2020 2/38

Some Firefox Perf Improvements, per Mike Conley

- don't animate out-of-view elements
- move db init off main thread
- keep better profiling data
- parallel painting for macOS
- lazily instantiate Search Service

- halve size of the blocklist
- refactor to reduce main-thread IO
- don't hold all frames of animated GIFs/APNGs in memory
- eliminate unnecessary hash table
- use more modern compiler

https://mikeconley.ca/blog/2018/02/14/ firefox-performance-update-1/

ECE 459 Winter 2020 3/38

We've seen this before:

- do less work (or do it sooner/later);
- use threads (move work off main thread);

■ measure performance;

Which of the updates fall into which categories?

ECE 459 Winter 2020 4/38

Some Firefox Perf Improvements, per Mike Conley

- don't animate out-of-view elements
- move db init off main thread
- keep better profiling data
- parallel painting for macOS
- lazily instantiate Search Service

- halve size of the blocklist
- refactor to reduce main-thread IO
- don't hold all frames of animated GIFs/APNGs in memory
- eliminate unnecessary hash table
- use more modern compiler

How?

- do less work (or do it sooner/later);
- use threads (move work off main thread);

measure performance;

Tab Warming

https://mikeconley.ca/blog/2018/01/11/
making-tab-switching-faster-in-firefox-with-tab-warming/.

"Maybe this is my Canadian-ness showing, but I like to think of it almost like coming in from shoveling snow off of the driveway, and somebody inside has already made hot chocolate for you, because they knew you'd probably be cold." — Mike Conley

ECE 459 Winter 2020 6/38

How Can Tab Warming Work?

Before: Firefox requests paint of newly-active tab, and then waits for the result before switching.

Idea: reduce user-visible latency by predicting an imminent tab switch.

Q: How can we predict the future?

Q': How can we predict which tab will be switched to?

ECE 459 Winter 2020 7/3

Predicting the future

A: When the user has a mouse, then the mouse cursor will hover over the next tab.

Assuming a sufficiently long delay between hover and click, the tab switch should be perceived as instantaneous. If the delay was non-zero but still not long enough, we will have nonetheless shaved that time off in eventually presenting the tab to you.

And in the event that we were wrong, and you weren't interested in seeing the tab, we eventually throw the uploaded layers away.

Blog post does not report performance numbers.

← ± ♥ ⊕ ⊕ districts → ± in □ ♠ =

The Beast adopted new raiment and studied the ways of Time and Space and Light and the Flow of energy through the Universe. From its studies, the Beast fashioned new structures from oxidised metal and proclaimed their glories. And the Beast's followers rejoiced, finding renewed purpose in these teachings.

from The Book of Mozilla, 11:14

ECE 459 Winter 2020 9/38

Faster Firefox Step 1: Electrolysis

Electrolysis (2017): multiple OS-level processes. (Think about threading models).

BROWSER ARCHITECTURE

ECE 459 Winter 2020 10/38

Chrome vs Firefox

Chrome: 1-process-per-tab.

Firefox: 4 shared content processes.

Firefox uses less memory (has less render state).

Electrolysis challenges: internal architecture, and add-ons.

ECE 459 Winter 2020 11/3

Electrolysis vs Flow

Two different Firefox projects:

ECE 459 Winter 2020 12/38

Steps:

- Measure slowness & prioritize
- Gather help
- Fix all (well, some of) the things!

In 6 months:

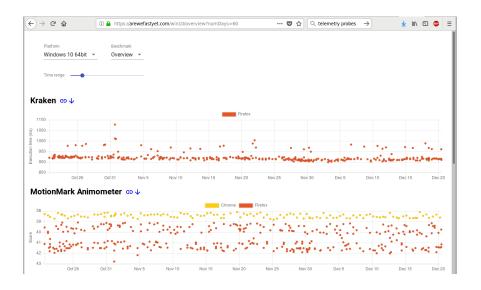

prioritized 895 bugs, fixed 369.

Key tool:

"Quantum Flow Engineering Newsletter".

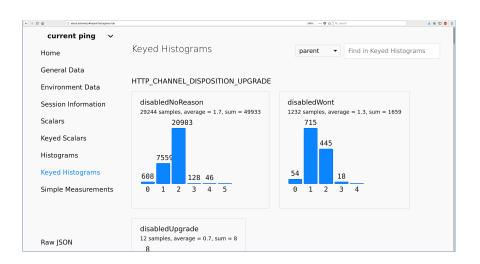

ECE 459 Winter 2020 13/38

arewefastyet dot com

ECE 459 Winter 2020 14/38

about:telemetry

ECE 459 Winter 2020 15/38

Idea: Ask questions first, act second.

Collect data about Firefox usage, then start hacking.

100s of GBs of anonymous metrics/day, publicly available.

Analogous to CPU profiling, but massively distributed.

collected much less often than CPU profiling data, but at much broader scope.

https://telemetry.mozilla.org/

ECE 459 Winter 2020 16/

Example Telemetry Questions

- Is Firefox the user's default browser? (69% yes)
- Does e10s make startup faster? (no, slower)
- Which plugins tend to freeze the browser on load? (Silverlight and Flash)

Can also see evolution of data over time.

ECE 459 Winter 2020 17/38

Devs can propose new probes; reviewed for data privacy plus normal code review.

ECE 459 Winter 2020 18/38

Firefox sends pings:

- "main ping" every 24 hours;
- upon shutdown;
- upon environment change;
- upon abnormal shutdown.

Presumably compressed JSON to Mozilla servers.

ECE 459 Winter 2020 19/3

```
type: <string>, // "main", "activation", "optout", ...
id: <UUID>, // a UUID that identifies this ping
creationDate: <ISO date>, // the date the ping was generated
version: <number>, // the version of the ping format
application: {
  architecture: <string>, // build architecture, e.g. x86
  buildId: <string>, // "20141126041045"
 // etc
},
clientId: <UUID>, // optional
environment: { ... }, // optional, not all pings contain
payload: { ... }, // actual payload data for this ping type
```

ECE 459 Winter 2020 20 / 38

Ping contents

- Scalars (counts, booleans, strings)
- Histograms = bucketed data (like grade distributions)

Both scalars and histograms can be keyed, e.g. how often searches happen for which search engines.

ECE 459 Winter 2020 21/38

Part II

Lower Level = Faster?

ECE 459 Winter 2020 22/38

ECE 459 Winter 2020 23/38

Introduction

C is low level, which is good for learning what's really going on.

Writing compact, readable code in C is hard. Common C sights:

- #define macros
- void*

C++11 has made major strides towards readability and efficiency (it provides light-weight abstractions).

ECE 459 Winter 2020 24/38

Outline

1 Sorting

2 Vectors vs. Lists

ECE 459 Winter 2020 25/38

Sort a bunch of integers.

In **C**, usually use qsort from stdlib.h.

■ A fairly ugly definition (as usual, for generic C functions)

ECE 459 Winter 2020 26/38

How ugly? qsort usage

```
#include <stdlib.h>
int compare(const void* a, const void* b)
{
    return (*((int*)a) - *((int*)b));
}
int main(int argc, char* argv[])
{
    int array[] = {4, 3, 5, 2, 1};
    qsort(array, 5, sizeof(int), compare);
}
```

■ This looks like a nightmare, and is more likely to have bugs.

ECE 459 Winter 2020 27 / 38

C++ has a sort with a much nicer interface¹...

```
template <class RandomAccessIterator>
void sort (
    RandomAccessIterator first ,
    RandomAccessIterator last
);

template <class RandomAccessIterator , class Compare>
void sort (
    RandomAccessIterator first ,
    RandomAccessIterator last ,
    Compare comp
);
```

^{1...}nicer to use, after you get over templates (they're useful, I swear).

```
#include <vector>
#include <algorithm>
int main(int argc, char* argv[])
{
    std::vector<int> v = {4, 3, 5, 2, 1};
    std::sort(v.begin(), v.end());
}
```

Note: Your compare function can be a function or a functor. By default, sort uses operator< on the objects being sorted.

■ Which is less error prone?

■ Which is **faster**?

ECE 459 Winter 2020 29/38

Timing Various Sorts

The C++ version is **twice** as fast. Why?

- The C version just operates on memory—it has no clue about the data.
- We're throwing away useful information about what's being sorted.
- A C function-pointer call prevents inlining of the compare function.

OK. What if we write our own sort in C, specialized for the data?

ECE 459 Winter 2020 30/38

Custom Sort

- The C++ version is still faster (although it's close).
- However, this is quickly going to become a maintainability nightmare.
 - Would you rather read a custom sort or 1 line?
 - What (who) do you trust more?

ECE 459 Winter 2020 31/38

Abstractions don't always make your program slower.

They allow speedups and are much easier to maintain and read.

ECE 459 Winter 2020 32/38

Let's throw Java-style programming (or at least collections) into the mix and see what happens.

ECE 459 Winter 2020 33 / 38

Outline

1 Sorting

2 Vectors vs. Lists

ECE 459 Winter 2020 34/38

Vectors vs. Lists: Problem

1. Generate **N** random integers and insert them into (sorted) sequence.

Example: 3 4 2 1

- **3**
- **3**4
- **234**
- **1234**
- 2. Remove **N** elements one at a time by going to a random position and removing the element.

Example: 2010

- **124**
- **2** 4
- **2**

For which **N** is it better to use a list than a vector (or array)?

ECE 459 Winter 2020 35/38

Complexity

Vector

- Inserting
 - \blacksquare $O(\log n)$ for binary search
 - \bigcirc O(n) for insertion (on average, move half the elements)
- Removing
 - O(1) for accessing
 - \blacksquare O(n) for deletion (on average, move half the elements)

List

- Inserting
 - \blacksquare O(n) for linear search
 - $\bigcirc O(1)$ for insertion
- Removing
 - O(n) for accessing
 - O(1) for deletion

Therefore, based on their complexity, lists should be better.

ECE 459 Winter 2020 36/38

Vectors dominate lists, performance wise. Why?

- Binary search vs. linear search complexity dominates.
- Lists use far more memory.

On 64 bit machines:

- Vector: 4 bytes per element.
- List: At least 20 bytes per element.
- Memory access is slow, and results arrive in blocks:
 - Lists' elements are all over memory, hence many cache misses.
 - A cache miss for a vector will bring a lot more usable data.

ECE 459 Winter 2020 37/38

Performance Tips: Bullets

■ Don't store unnecessary data in your program.

■ Keep your data as compact as possible.

■ Access memory in a predictable manner.

■ Use vectors instead of lists by default.

■ Programming abstractly can save a lot of time.

ECE 459 Winter 2020 38/38
