# Lecture 27 — Liar, Liar, Memory Profiling

Patrick Lam & Jeff Zarnett patrick.lam@uwaterloo.ca jzarnett@uwaterloo.ca

Department of Electrical and Computer Engineering University of Waterloo

September 4, 2022

ECE 459 Winter 2023 1/50

ECE 459 Winter 2023 2/50

# Sampling Based Profiling

Let's open with a video that illustrates one of the problems with sampling-based profiling:

https://www.youtube.com/watch?v=jQDjJRYmeWg

Is this fake?

ECE 459 Winter 2023 3/50

# **Assumptions**

The main assumptions underlying sampling are that:

Samples are "random"; and

The sample distribution approximates the actual time-spent distribution.

ECE 459 Winter 2023 4/50

# In the Criminal Justice System...

#### Who can we trust?

ECE 459 Winter 2023 5/50

# Part II

# **Lies from Metrics**

ECE 459 Winter 2023 6/50

# Lying perf counters

While app-specific metrics can lie too, mostly we'll talk about CPU perf counters.

Reference: Paul Khuong,

http://www.pvk.ca/Blog/2014/10/19/performance-optimisation-~-writing-an-essay/

ECE 459 Winter 2023 7/50

#### mfence

We've talked about mfence. Used in spinlocks, for instance.

Profiles said: spinlocking didn't take much time. Empirically: eliminating spinlocks = better than expected!

ECE 459 Winter 2023 8/50

# Exploring the lie

Next step: create microbenchmarks.

Memory accesses to uncached locations, or computations,

surrounded by store pairs/mfence/locks.

Use perf to evaluate impact of mfence vs lock.

ECE 459 Winter 2023 9/50

```
$ perf annotate -s cache misses

```

ECE 459 Winter 2023 12/50

### mfence's effects

Looks like the reads take 85% of runtime, while the mfence takes 15% of runtime.

ECE 459 Winter 2023 13/50

# Bigger picture

Must also look at total # of cycles.

No atomic/fence: 2.81e9 cycles lock inc/dec: 3.66e9 cycles mfence: 19.60e9 cycles

That 15% number is a total lie.

ECE 459 Winter 2023 14/50

#### **Conclusions**

- mfence underestimated;
- lock overestimated.

#### Why?

mfence = pipeline flush, costs attributed to instructions being flushed.

ECE 459 Winter 2023 15/50

# Part III

# The Long Tail

ECE 459 Winter 2023 16/50

### The Long Tail

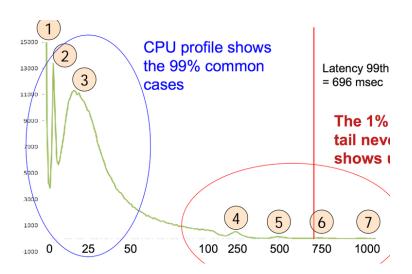

Suppose we have a task that's going to get distributed over multiple computers (like a search).

If we look at the latency distribution, the problem is mostly that we see a long tail of events.

When we are doing a computation or search where we need all the results, we can only go as the slowest step.

ECE 459 Winter 2023 17/50

# Grab the Tiger by the Tail

ECE 459 Winter 2023 18/50

# **Explaining the Peaks**

- Found in RAM
- 2 Disk Cache
- 3 Disk
- and above... very strange!

ECE 459 Winter 2023 19/50

# Why 250, 500, 750, 1000?

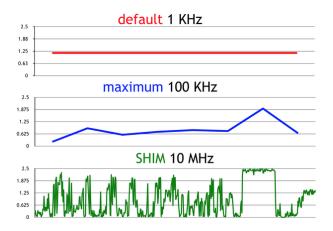

Answer: CPU throttling!

This was happening on 25% of disk servers at Google, for an average of half an hour a day!

ECE 459 Winter 2023 20 / 50

# Faster than a Speeding Bullet

Another problem with sampling, this time from Lucene:

Why is perf limited to 100 KHz?

# **Processing Interrupts**

Answer: perf samples are done with interrupts (slow).

If you crank up the rate of interrupts, before long, you are spending all your time handling the interrupts rather than doing useful work.

SHIM gets around this by being more invasive.

This produces a bunch of data which can be dealt with later.

ECE 459 Winter 2023 22/50

### Part IV

# **Lies from Counters**

ECE 459 Winter 2023 23/50

#### **Counter This**

Rust compiler hackers were trying to include support for hardware performance counters (what perf reports).

To make counters as deterministic as possible:

- disable Address Space Layout Randomization (randomized pointer addresses affect hash layouts);
- subtract time spent processing interrupts (IRQs);
- profile one thread only (if you can, in your context).

ECE 459 Winter 2023 24/50

#### Problem?

E dith B inch @eddyb\_r · Nov 4

000

AMD: we made a really clever speculative thing that keeps executing instructions normally even

me: okay but what do you do when it fails

AMD: 😅 it uhhh rolls back time to the point of divergence 😅

me: cool, cool, but did you remember you also roll back the perf counters?

AMD: 😬

 $\bigcirc$ 

30

,1

ECE 459 Winter 2023 25/50

#### Part V

# Lies about Calling Context

ECE 459 Winter 2023 26/50

# Profilers, Lying?

This part is somewhat outdated now, as it's a pretty specific technical problem that especially arises under the gprof tool.

It's still a good example of lying tools, though.

Reference: Yossi Kreinin,

http://www.yosefk.com/blog/how-profilers-lie-the-cases-of-gprof-and-kcachegrind.html

ECE 459 Winter 2023 27/50

## gprof said what?

gprof uses two C standard-library functions: profil() and mcount().

- **profil()**: asks glibc to record which instruction is currently executing (100×/second).
- mcount(): records call graph edges; called by -pg instrumentation.

ECE 459 Winter 2023 28/50

### **Getting it Wrong**

Hence, **profil** information is statistical, while **mcount** information is exact.

gprof can draw unreliable inferences.

If you have a method easy and a method hard, each of which is called once, and hard takes up almost all the CPU time...

gprof might divide total time by 2 and report bogus results.

ECE 459 Winter 2023 29 / 50

# What's Wrong?

The following results from gprof are suspect (among others):

- contribution of children to parents;
- total runtime spent in self+children;

When are call graph edges right? Two cases:

- functions with only one caller (e.g. f() only called by g()); or,
- functions which always take the same time to complete (e.g. rand()).

ECE 459 Winter 2023 30 / 50

#### **Other Tools**

Next, we'll talk about callgrind/KCacheGrind.

KCacheGrind is a frontend to callgrind. callgrind gives better information, but imposes more overhead.

KCacheGrind works properly on the earlier hard/easy example, but we can still deceive it with more complicated examples.

ECE 459 Winter 2023 31/50

# Lies summary

Some results are exact; some results are sampled; some results are interpolated.

If you understand the tool, you understand where it can go wrong.

Understand your tools!

ECE 459 Winter 2023 32 / 50

### Part VI

# **Memory Profiling**

ECE 459 Winter 2023 33/50

# Memory Profiling Return to Asgard

So far: CPU profiling.

Memory profiling is also a thing; specifically heap profiling.

"Still Reachable": not freed & still have pointers, but should have been freed?

ECE 459 Winter 2023 34/50

# **Memory Profiling Return to Asgard**

As with queueing theory: allocs > frees  $\Longrightarrow$  usage  $\to \infty$ 

At least more paging, maybe total out-of-memory.

But! Memory isn't really lost: we could free it.

Our tool for this comes from the Valgrind tool suite.

ECE 459 Winter 2023 35/50

DHAT tracks allocation points and what happens to them over a program's execution.

An allocation point is a point in the program which allocates memory.

ECE 459 Winter 2023 36/50

```
AP 1.1.1.1/2 {
  Total:
             31,460,928 bytes (2.32%, 1,565.9/Minstr) in 262,171 blocks (4.41%, 13.05/Minst
     avg size 120 bytes, avg lifetime 986.406.885.05 instrs (4.91% of program duration)
  Max:
             16,779,136 bytes in 65,543 blocks, avg size 256 bytes
  At t-gmax: 0 bytes (0%) in 0 blocks (0%), avg size 0 bytes
  At t-end: 0 bytes (0%) in 0 blocks (0%), avg size 0 bytes
  Reads:
             5,964,704 bytes (0.11%, 296.88/Minstr), 0.19/byte
 Writes:
             10.487.200 bytes (0.51%, 521.98/Minstr), 0.33/byte
  Allocated at {
    ^1: 0x95CACC9: alloc (alloc.rs:72)
      [omitted]
    ^7: 0x95CACC9: parse_token_trees_until_close_delim (tokentrees.rs:27)
    ^8: 0x95CACC9: syntax::parse::lexer::tokentrees::<impl syntax::parse::lexer::
                          StringReader<'a>>::parse_token_tree (tokentrees.rs:81)
    ^9: 0x95CAC39: parse_token_trees_until_close_delim (tokentrees.rs:26)
    ^10: 0x95CAC39: syntax::parse::lexer::tokentrees::<impl syntax::parse::lexer::
                          StringReader<'a>>::parse_token_tree (tokentrees.rs:81)
    #11: 0x95CAC39: parse_token_trees_until_close_delim (tokentrees.rs:26)
    #12: 0x95CAC39: svntax::parse::lexer::tokentrees::<impl svntax::parse::lexer::</pre>
                          StringReader<'a>>::parse_token_tree (tokentrees.rs:81)
```

ECE 459 Winter 2023 37/50

Going up the tree, DHAT tells you about all of the allocation points that share a call-stack prefix.

The ^ before the number indicates that the line is copied from the parent.

A # indicates that the line is unique to that node.

A sibling of the example above would diverge at the call on line 10.

ECE 459 Winter 2023 38/50

### Shieldmaiden to Thor

ECE 459 Winter 2023 39 / 50

What does Massif do?

■ How much heap memory is your program using?

■ How did this happen?

Next up: example from Massif docs.

ECE 459 Winter 2023 40/50

#### **Example Allocation Program**

```
fn g() {
    let a = Vec:: < u8 > :: with_capacity (4000);
    std::mem::forget(a)
fn f() {
    let a = Vec:: < u8 > :: with_capacity (2000);
    std::mem::forget(a);
    g()
fn main() {
    let mut a = Vec:: with_capacity(10);
    for _i in 0..10 {
        a.push(Box::new([0;1000]))
    f();
    g();
```

ECE 459 Winter 2023 41/50

After we compile, run the command:

```
plam@amqui ~/c/p/l/L/alloc> valgrind --tool=massif target/debug/alloc
==406569== Massif, a heap profiler
==406569== Copyright (C) 2003-2017, and GNU GPL'd, by Nicholas Nethercote
==406569== Using Valgrind-3.16.1 and LibVEX; rerun with -h for copyright info
==406569== Command: target/debug/alloc
==406569==
==406569==
```

ECE 459 Winter 2023 42 / 50

#### What happened?

- The program ran slowly (because Valgrind!)
- No summary data on the console (like memcheck or helgrind or cachegrind.)

Weird. What we got instead was the file massif.out.[PID].

ECE 459 Winter 2023 43 / 50

massif.out.[PID]:
plain text, sort of readable.

Better: ms\_print.

Which has nothing whatsoever to do with Microsoft. Promise.

ECE 459 Winter 2023 44/5

### **Post-Processed Output**

ECE 459 Winter 2023 45 / 50

## User Friendly, But Not Useful

For a long time, nothing happens, then...kaboom!

Why? We gave it a trivial program.

We should tell Massif to care more about bytes than CPU cycles, with --time-unit=B.

Let's try that.

ECE 459 Winter 2023 46/50

### Valgrind (Memcheck) First

Run valgrind (Memcheck) first and make it happy before we go into figuring out where heap blocks are going with Massif.

Okay, what to do with the information from Massif, anyway?

#### Easy!

- Start with peak (worst case scenario) and see where that takes you (if anywhere).
- You can probably identify some cases where memory is hanging around unnecessarily.

ECE 459 Winter 2023 47 / 50

#### Places to Look with Massif

Memory usage climbing over a long period of time, perhaps slowly, but never decreasing—memory filling with junk?

Large spikes in the graph—why so much allocation and deallocation in a short period?

ECE 459 Winter 2023 48/50

# Other Massif-ly Useful Things

- stack allocation (--stacks=yes).
- children of a process (anything split off with fork) if desired.
- low level stuff: if going beyond malloc, calloc, new, etc. and using mmap or brk that is usually missed, can do profiling at page level (--pages-as-heap=yes).

ECE 459 Winter 2023 49/50

#### **Live Demos**

As is often the case, we have examined the tool on a trivial program.

Let's see if we can do some live demos of Massif at work.

ECE 459 Winter 2023 50/50
