## Lecture 35 — DevOps, but Operations

Patrick Lam & Jeff Zarnett patrick.lam@uwaterloo.ca jzarnett@uwaterloo.ca

Department of Electrical and Computer Engineering University of Waterloo

December 19, 2022

ECE 459 Winter 2023 1/29

## **Devops, but Operations**

Services are doing The Thing – but how do we know if there's a problem? Monitoring and Alerting.

"Action stations. Set Condition 1 throughout the ship!"

ECE 459 Winter 2023 2/29

#### What to Monitor?

What to monitor and what to do about it?

Applications have health checks, but how basic should they be?

Maybe automate testing the basic workflow.

These don't show performance problems.

ECE 459 Winter 2023 3/29

## What To Monitor, For Real?

- CPU Load
- Memory Utilization
- Disk Space
- Disk I/O
- Network Traffic
- Clock Skew
- Queue lengths
- Application Response Times

ECE 459 Winter 2023 4/29

# **Overview and Summary**

It would be good to have a dashboard of some sort.

It's a little late to recommend you take a course in the future...

Dashboards are cool but shouldn't be used to identify alerts.

ECE 459 Winter 2023 5/29

#### **Alert Conditions**

- CPU usage exceeding threshold for a certain period of time
- Increased rate of error logs over a period of time
- A service has restarted many times recently
- Queue length very long
- Taking too long to complete a workflow

ECE 459 Winter 2023 6/29

ECE 459 Winter 2023 7/29

## Sir Arthur Conan Doyle Nerdery

Remember also the lesson from Sherlock Holmes in "The Adventure of Silver Blaze" – the dog that did not bark was a clue as to who did the crime.

ECE 459 Winter 2023 8 / 29

## **Customer Support**

The final option for detecting a problem is customer support.

Automated monitoring maybe can't find everything every time, but we shouldn't be relying on this as the primary mechanism.

ECE 459 Winter 2023 9 / 29

#### **Red Alert**

- Alerts: a human must take action now;
- **Tickets**: a human must take action soon (hours or days);
- Logging: no need to look at this except for forensic/diagnostic purposes.

Common bad situation: logs-as-tickets.

ECE 459 Winter 2023 10/29

We usually talk about it in the metaphor of pagers, as in the small rectangular box that wakes up doctors when patients need them.

The alert may contain some information about the event that has caused it.

Example: Service A CPU usage is high.

ECE 459 Winter 2023 11/29

## Beep Beep

What do you do when you hear the fire alarm?

ECE 459 Winter 2023 12/29

# Back to Sleep

We have experienced too many false alarms.

If there is an actual fire, you will not only be wrong, you might also be dead.

ECE 459 Winter 2023 13/29

#### Not the Kittens!!!

Alerts and tickets are a great way to make user pain into developer pain.

Some SUPER CRITICAL ticket OMG KITTENS ARE ENDANGERED is an excellent way to learn the lesson...

Devs will take steps that keep these things from happening in the future.

ECE 459 Winter 2023 14/29

#### **Incident Reports**

Learning from incidents requires reports (post-mortems).

Identify root causes and what we can learn.

Reports are worth doing even if they aren't fun.

ECE 459 Winter 2023 15 / 29

### **Report Content**

Breakdown of what happened with timeline.

What happened, when it was noticed, actions taken, when it was resolved.

ECE 459 Winter 2023 16/29

## **Root Cause Analysis**

There are two kinds of causes: root causes and proximate causes.

Example: deadlock.

How far do we go in terms of finding the root cause?

ECE 459 Winter 2023 17/29

## Toyota Methodology: Five Whys

Toyota model: ask "why?" five times to get to the root cause.

Does not have to be exactly 5; use judgement.

Too few times  $\rightarrow$  superficial answers.

Too many times  $\rightarrow$  "computers were a mistake."

ECE 459 Winter 2023 18/29

#### **Action Items**

What will we do in the short term and long term?

Prevent this from happening again.

ECE 459 Winter 2023 19/29

#### Be Realistic

Action items have to be realistic...

Probably cannot say rewrite all code in Rust.

Not every report results in major head-exploding conclusions.

ECE 459 Winter 2023 20 / 29

## Not Included In Report

Avoid having:

- Irrelevant detail
- Speculation
- Blaming
- Blaming

ECE 459 Winter 2023 21/29

# Security, Report to the Bridge

Having an always-available service accessible over the internet makes security a very big concern.

ECE 459 Winter 2023 22 / 29

#### **Risk Enormous**

You can run some program with tons of security vulnerabilities offline and feel that the security problems can be managed.

When it's online the risk is enormous.

All kinds of vulnerabilities are a problem, but I'll call out two of them:

Code execution/injection and data leakage (information exposure).

ECE 459 Winter 2023 23/29

# Abusing Free Services for Fun and Profit

Real-life attack about abusing free CPU time from cloud providers.

These are there for non-nefarious purposes but can be abused.

Also consider a scenario where attackers use your resources!

ECE 459 Winter 2023 24/29

## Abusing Free Services for Fun and Profit

Bypass signup limitations, browser scripting.

Mining cryptocurrency – inefficiently – but works.

Using \$103 000 of resources produces one coin worth about \$137: 0.13% return. Or free money from attacker POV.

ECE 459 Winter 2023 25 / 29

# Abusing Free Services for Fun and Profit

Disguise what is happening: no container called mine-crypto-lol linux88884474 instead.

Generate random Github action names.

Spotting crypto mining is easier because it's CPU intensive... What about spyware, sending secrets to extortion rings?

ECE 459 Winter 2023 26 / 29

#### **Information Exposure**

Information Exposure is bad for your reputation and expensive.

GDPR infractions get expensive: https://enforcementtracker.com/

Fines are for things like insufficient technical measures.

ECE 459 Winter 2023 27 / 29

#### Fun Example

Remember talking about logging in tracing? Logging PII there was a big risk!

An example of a security process backfiring.

ECE 459 Winter 2023 28 / 29

#### **Audit This**

There are some companies out there that will check your code for libraries with versions having known security vulnerabilities.

Sadly, when there is an updated version of a library, there may be breaking changes in it...

Checking for vulnerabilities should be an automatic process as part of your build and release procedures.

ECE 459 Winter 2023 29 / 29
