ECE 459 Winter 2023 1/44

Part I

Profiling

ECE 459 Winter 2023 2 / 44

Basic Overview

General idea:

collect data on what parts of the code are taking up most of the time.

- What functions get called?
- How long do functions take?
- What's using memory?

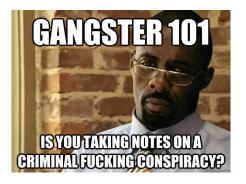

ECE 459 Winter 2023 3/44

printf

There is always the "informal" way: "debug" by print statements.

On entry to foo, log "entering function foo", plus timestamp.

On exit, log "exiting foo", also with timestamp.

ECE 459 Winter 2023 4 / 44

Console Profiling

Kind of works, and [JZ] has used it... But this approach is not necessarily good.

This is "invasive" profiling—change the source code of the program to add instrumentation (log statements).

Plus we have to do a lot of manual accounting.

Doesn't really scale.

ECE 459 Winter 2023 5/44

Profiling my Kernel

Iran the command nvprof target/release/nbody-cuda.

```
==20734== Profiling application: target/release/nbody-cuda
==20734== Profiling result:
           Type Time(%)
                               Time

```

ECE 459 Winter 2023 7/44

Wizardry!

Like debugging: if you get to be a wizard you can maybe do it by code inspection.

I think you should be a little more specific, here in Step 2

But speculative execution inside your head is harder for perf than debugging.

So: we want to use tools and do this in a methodical way.

ECE 459 Winter 2023 8 / 44

Introduction to Profiling

So far we've been looking at small problems.

Must **profile** to see what's slow in a large program.

Two main outputs:

- flat;
- call-graph.

Two main data gathering methods:

- statistical;
- instrumentation.

ECE 459 Winter 2023 9 / 44

Profiler Outputs

Flat Profiler:

- Only computes average time in a particular function.
- Does not include other (useful) information (callees).

Call-graph Profiler:

- Computes call times.
- Reports frequency of function calls.
- Gives a call graph: who called what function?

ECE 459 Winter 2023 10/44

Data Gathering Methods

Statistical:

Mostly, take samples of the system state, that is:

- every 100ms, check the system state.
- will cause some slowdown, but not much.

Instrumentation:

Add instructions at specified program points:

- can do this at compile time or run time (expensive);
- can instrument either manually or automatically;

■ like conditional breakpoints.

ECE 459 Winter 2023 11/44

Guide to Profiling

When writing large software projects:

- First, write clear and concise code.
 Don't do premature optimizations focus on correctness.
- Profile to get a baseline of your performance:
 - allows you to easily track any performance changes;
 - allows you to re-design your program before it's too late.

Focus your optimization efforts on the code that matters.

ECE 459 Winter 2023 12/44

Things to Look For

Good signs:

- Time is spent in the right part of the system.
- Most time should not be spent handling errors; in non-critical code; or in exceptional cases.
- Time is not unnecessarily spent in OS.

Kitchener driver follows GPS directions right into Lake Huron...

ECE 459 Winter 2023 13 / 44

Development vs Prod

You can always profile your systems in development, but that might not help with complexities in production.

The constraints on profiling production systems are that the profiling must not affect the system's performance or reliability.

ECE 459 Winter 2023 14/44

Per-Process

We'll first talk about perf, the profiler recommended for use with Rust. This is Linux-specific, though.

The perf tool is an interface to the Linux kernel's built-in sample-based profiling using CPU counters.

ECE 459 Winter 2023 15 / 44

Previous Offering Profiling

```
[plam@lynch nm-morph]$ perf stat ./test harness

       155,568,356 branch-misses
                                              #
                    [83.36%]
       6.580225847 seconds time elapsed
```

ECE 459 Winter 2023 16 / 44

Do it with Rust

The first thing to do is to compile with debugging info, go to your Cargo.toml file and add:

```
[profile.release]
debug = true
```

This means that cargo build --release will now compile the version with debug info.

ECE 459 Winter 2023 17 / 44

I've got a Cunning Plan

Run the program using perf record, which will sample the execution of the program to produce a data set.

Then there are three ways we can look at the code: perf report, perf annotate, and a flamegraph.

ECE 459 Winter 2023 18/44

During development of some of the code exercises, I used the CLion built-in profiler for this purpose.

It generates a flamegraph for you too, and I'll show that for how to create the flamegraph as well.

ECE 459 Winter 2023

Part II

Profiler Guided Optimization

ECE 459 Winter 2023 20/44

Profiler Guided Optimization

Using static analysis, the compiler makes its best predictions about runtime behaviour.

Example: branch prediction.

```
fn which_branch(a: i32, b: i32) {
    if a < b {
        println!("Case one.");
    } else {
        println!("Case two.");
    }
}</pre>
```

ECE 459 Winter 2023 21/44

A Virtual Call to Devirtualize

```
trait Polite {
    fn greet(&self) -> String;
}

struct Kenobi {
    /* Stuff */
}
impl Polite for Kenobi {
    fn greet(&self) -> String {
        return String::from("Hello there!");
    }
}
```

```
struct Grievous {
    /* Things */
}
impl Polite for Grievous {
    fn greet(&self) -> String {
        return String::from("General Kenobi.");
    }
}
fn devirtualization(thing: &Polite) {
    println!("{}", thing.greet());
}
```

ECE 459 Winter 2023 22 / 44

```
fn match_thing(x: i32) -> i32 {
    match x {
        0..10 => 1,
        11..100 => 2,
        _ => 0
    }
}
```

Same thing with x: what is its typical value? If we know that, it is our prediction.

Actually, in a match block with many options, could we rank them in descending order of likelihood?

ECE 459 Winter 2023 23 / 44

Adapting to an Uncertain World

How can we know where we go?

■ could provide hints...

Java HotSpot virtual machine: updates predictions on the fly.

So, just guess.

If wrong, the Just-in-Time compiler adjusts & recompiles.

The compiler runs and it does its job and that's it; the program is never updated with newer predictions if more data becomes known.

ECE 459 Winter 2023 24 / 44

Profiling Mitigates Uncertainty

Rust: usually no adaptive runtime system.

POGO:

- observe actual runs;
- predict the future.

So, we need multi-step compilation:

- compile with profiling;
- run to collect data;
- recompile with profiling data to optimize.

ECE 459 Winter 2023 25/44

Step One: Measure

First, generate an executable with instrumentation.

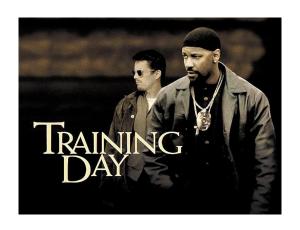

The compiler inserts a bunch of probes into the generated code to record data.

- Function entry probes;
- Edge probes;
- Value probes.

Result: instrumented executable plus empty database file (for profiling data).

ECE 459 Winter 2023 26 / 44

Step Two: Training Day

ECE 459 Winter 2023 27 / 44

Step Two: Training Day

Second, run the instrumented executable.

Real-world scenarios are best.

Ideally, spend training time on perf-critical sections.

Use as many runs as you can stand.

ECE 459 Winter 2023 28 / 44

Step Two: Training Day

Don't exercise every part of the program (not SE 465/ECE 453 here!)

That would be counterproductive.

Usage data must match real world scenarios, ... or the compiler gets misinformed about what's important.

Or you might end up teaching it that almost nothing is important... ("everything's on the exam!")

ECE 459 Winter 2023 29 / 44

Step Three: Recompile

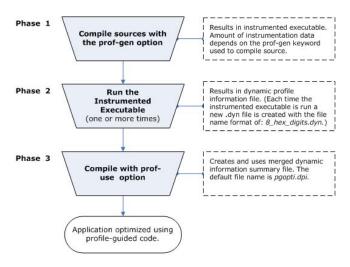

Finally, compile the program again.

Inputs: source plus training data.

Outputs: (you hope) a better output executable than from static analysis alone.

ECE 459 Winter 2023 30 / 44

Summary Graphic

ECE 459 Winter 2023 31/44

Save Some Steps

Not necessary to do all three steps for every build.

Re-use training data while it's still valid.

Recommended dev workflow:

- dev A performs these steps, checks the training data into source control
- whole team can use profiling information for their compiles.

ECE 459 Winter 2023 32 / 44

Not fixing all the problems in the world

What does it mean for it to be better?

The algorithms will aim for speed in areas that are "hot".

The algorithms will aim for minimal code size in areas that are "cold".

Less than 5% of methods compiled for speed.

ECE 459 Winter 2023 33/44

Combining Training Runs

Can combine multiple training runs and manually give suggestions about important scenarios.

The more a scenario runs in the training data, the more important it will be, from POGO's point of view.

Can merge multiple runs with user-assigned weightings.

ECE 459 Winter 2023 34 / 44

Full Test Scenario

ECE 459 Winter 2023 35 / 44

Behind the Scenes

In the optimize phase, compiler uses the training data for:

- Full and partial inlining
- 2 Function layout
- 3 Speed and size decision
- Basic block layout
- 5 Code separation
- 6 Virtual call speculation
- Switch expansion
- 8 Data separation
- 9 Loop unrolling

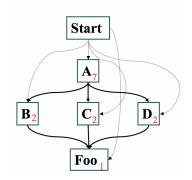

ECE 459 Winter 2023 36/44

Muh Gainz

Most performance gains from inlining.

Decisions based on the call graph path profiling.

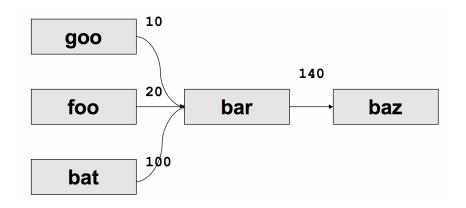

But: behaviour of function foo may be very different when called from B than when called from D.

ECE 459 Winter 2023 37/44

Another Call Graph

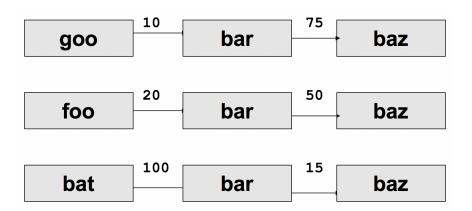

Example 2 of relationships between functions. Numbers on edges represent the number of invocations:

ECE 459 Winter 2023 38 / 44

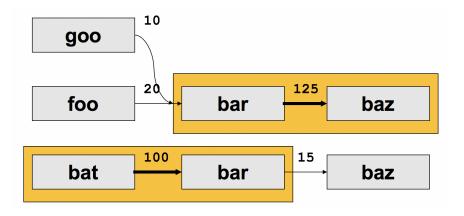

The POGO View of the World

When considering what to do here, POGO takes the view like this:

ECE 459 Winter 2023 39 / 44

The POGO View of the World

ECE 459 Winter 2023 40 / 44

Page Locality

Call graph profiling data also good for packing blocks.

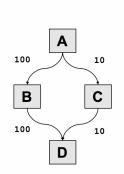

Put most common cases nearby.
Put successors after their predecessors.

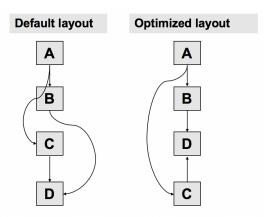

Packing related code = fewer page faults (cache misses).

Calling a function in same page as caller = "page locality".

ECE 459 Winter 2023 41/44

Block Layout

ECE 459 Winter 2023 42 / 44

Dead Code?

According to the author, "dead" code goes in its own special block.

Probably not truly dead code (compile-time unreachable).

Instead: code that never gets invoked in training.

ECE 459 Winter 2023 43 / 44

Benchmark Results

OK, how well does POGO work?

The application under test is a standard benchmark suite (Spec2K):

Spec2k:	sjeng	gobmk	perl	povray	gcc
App Size:	Small	Medium	Medium	Medium	Large
Inlined Edge Count	50%	53%	25%	79%	65%
Page Locality	97%	75%	85%	98%	80%
Speed Gain	8.5%	6.6%	14.9%	36.9%	7.9%

We can speculate about how well synthetic benchmarks results translate to real-world application performance...
