Lecture 24 — Large Language Models

Jeff Zarnett jzarnett@uwaterloo.ca

Department of Electrical and Computer Engineering University of Waterloo

September 19, 2023

ECE 459 Winter 2023 1/38

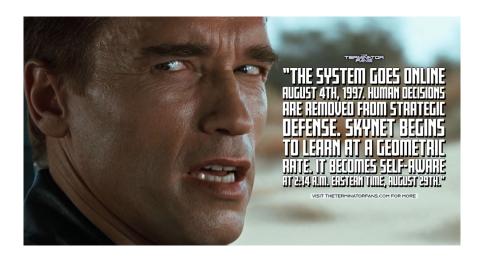

In the Beginning

In November of 2022, OpenAI introduced ChatGPT to the world...

ECE 459 Winter 2023 2/38

Reaction 1

ECE 459 Winter 2023 3/38

Reaction 2

ECE 459 Winter 2023 4/38

I enjoy rephrasing my question 15 different ways until I get the answer I want

I'm a Prompt Engineer

ECE 459 Winter 2023 5/38

Reaction 4

ECE 459 Winter 2023 6/38

ChatGPT

Such large language models have existed before, but ChatGPT ended up a hit because it's pretty good at being "conversational".

This is referred to as Natural Language Processing (NLP).

ECE 459 Winter 2023 7/38

Just because it gives you an answer, doesn't mean the answer is correct or true.

AI is subject to hallucinations.

ECE 459 Winter 2023 8/38

Remember, The Law...

Legally and professionally, the engineer is responsible for understanding how a given tool works & verifying the output is reasonable & correct.

ECE 459 Winter 2023 9/38

Prepared in Advance?

Part of what makes the GPT-3 and GPT-4 models better at producing output that matches our expectations is that it relies on pre-training.

This course is not one on neural networks, large language models, AI, or similar.

But performance is relevant here!

ECE 459 Winter 2023 10/38

Parameters

One factor that matters in how good a model is: parameters.

Bigger is usually better...

But requires more computational and memory resources.

We can maybe tune some options!

ECE 459 Winter 2023 11/38

Let's Try Some Optimization

This section is based on a guide from "Hugging Face".

You may have guessed by the placement of this topic in the course material that the GPU is the right choice for how to generate or train a large language model.

ECE 459 Winter 2023 12/38

About that Name

Just... uh... don't confuse Hugging Face with Facehugger...

ECE 459 Winter 2023 13/38

Why a GPU?

In this case we're talking about Transformers.

There are three main groups of optimizations that it does:

- Tensor Contractions
- Statistical Normalizations
- Element-Wise Operators

We also need to consider what's in memory.

ECE 459 Winter 2023 14/38

Optimize What?

We can focus on how to generate a model that gives answers quickly...

Or we can focus on how to generate or train the model quickly.

ECE 459 Winter 2023 15/38

Make a Fast Model

Use more space to reduce CPU usage, optimize for common cases, speculate...

Some of these are more fun than others: given a particular question, can you guess what the followup might be?

ECE 459 Winter 2023 16/38

Make a Model Fast

Why would we customize some LLM?

Don't send your data to OpenAl...

Specialize for your workload.

ECE 459 Winter 2023 17/38

Batch Size

Our first major optimization, and perhaps the easiest to do, is the batch size.

ECE 459 Winter 2023 18/38

Let's Review the Code

The code is a little too large for the slides so let's go over it in a code editor.

The bert-large-uncased model is about 340 MB.

It's uncased because it makes no distinction between capitals and lower-case letters, e.g., it sees "Word" and "word" as equivalent.

ECE 459 Winter 2023 19/38

Let's Try Training

```
izarnett@ecetesla0:~/github/ece459/lectures/live-coding/L24$ pvthon3 dummv_data.pv
Starting up. Initial GPU utilization:
GPU memory occupied: 0 MB.
Initialized Torch: current GPU utilization:
GPU memory occupied: 417 MB.
Some weights of BertForSequenceClassification were not initialized
from the model checkpoint at bert-large-uncased and are newly initialized:
['classifier.bias', 'classifier.weight']
You should probably TRAIN this model on a down-stream task to be able
to use it for predictions and inference.
GPU memory occupied: 1705 MB.
torch.cuda.OutOfMemorvError: CUDA out of memory. Tried to allocate 20.00 MiB (GPU 0:
7.43 GiB total capacity; 6.90 GiB already allocated; 16.81 MiB free; 6.90 GiB
reserved in total by PyTorch) If reserved memory is >> allocated memory try setting
max_split_size_mb to avoid fragmentation. See documentation for Memory Management
and PYTORCH CUDA ALLOC CONF
```

ECE 459 Winter 2023 20 / 38

Let's See the Problem

Lasked nvidia-smi...

```
NVIDIA-SMI 470.199.02 Driver Version: 470.199.02 CUDA Version: 11.4
              Persistence-M| Bus-Id

                                    Memory-Usage | GPU-Util Compute M.
                                                               MIG M.
    Tesla P4
                       Off
                             000000000:17:00.0 Off
N/A
              23W / 75W |
                                  0MiB / 7611MiB |
                                                  1% Default
                                                                  N/A
Processes:
 GPU
                    PID
                                                            GPU Memory
                         Type
                               Process name
      TD
                                                            Usage
 No running processes found
```

ECE 459 Winter 2023 21/38

Kirk to Engineering...

7 611 MB is not enough for this model...

Problem is we don't have any bigger VRAM cards.

ECE 459 Winter 2023 22 / 38

Fine, I Guess

What I actually did next was change to a smaller version of the model, bert-base-uncased.

It's significantly smaller (110 MB) and something the card could handle.

ECE 459 Winter 2023 23 / 38

Smaller Model Output

```
izarnett@ecetesla0:~/github/ece459/lectures/live-coding/L24$ python3 dummy_data.py
Starting up. Initial GPU utilization:
GPU memory occupied: 0 MB.
Initialized Torch: current GPU utilization:
GPU memory occupied: 417 MB.
Some weights of BertForSequenceClassification were not initialized from the
model checkpoint at bert-base-uncased and are newly initialized:
['classifier.weight', 'classifier.bias']
You should probably TRAIN this model on a down-stream task to be able to use
 it for predictions and inference.
GPU memory occupied: 887 MB.
{'loss': 0.0028. 'learning_rate': 1.171875000000001e-06. 'epoch': 0.98}
{'train_runtime': 109.6152, 'train_samples_per_second': 4.671,
'train_steps_per_second': 4.671. 'train_loss': 0.0027378778694355788. 'epoch': 1.0}
Time: 109.62
Samples/second: 4.67
GPU memory occupied: 3281 MB.
```

ECE 459 Winter 2023 24/38

Results Table

Then I needed to experiment some more with batch size to find the ideal.

Batch Size	Time (s)	Samples/s	Memory Used (MB)	Utilization (%)
1	109.62	4.67	3 281	43.1
2	85.82	5.97	3 391	44.6
4	72.18	7.09	4 613	60.6
8	66.70	7.68	7 069	92.9

Unsurprisingly, choosing batch size of 9 leads to OOM.

ECE 459 Winter 2023 25/38

We seem to be memory limited – let's see what we can do?

First idea: gradient accumulation.

Calculate gradients in small increments rather than for the whole batch.

ECE 459 Winter 2023 26/38

Experimenting with Gradient Accumulation

Steps	Time (s)	Samples/s	Memory Used (MB)	Utilization (%)
1	66.06	7.75	7 069	92.9
2	63.96	8.01	7 509	98s.7
4	62.81	8.15	7 509	98.7
8	62.65	8.17	7 509	98.7
16	62.42	8.20	7 509	98.7
32	62.44	8.20	7 509	98.7
128	62.20	8.23	6 637	87.2
1024	61.78	8.29	6 637	87.2
4096	62.16	8.24	6 637	87.2

ECE 459 Winter 2023 27/38

I got Suspicious

I got suspicious about the 128 dropoff in memory usage and it made me think about other indicators – is it getting worse somehow?

The output talks about training loss...

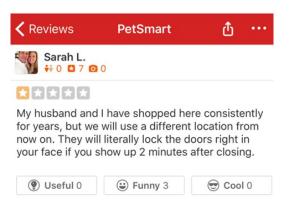

Gradient Accumulation Steps	Loss
1	0.029
2	0.070
4	0.163
8	0.169
16	0.447
32	0.445
128	0.435
1024	0.463
4096	0.014

Is that concerning?

ECE 459 Winter 2023 28/38

We need to do some validation of how it's going...

We'll train and validate using some Yelp data.

ECE 459 Winter 2023 29 / 38

More Code, More Review

The python code here is significantly different but we'll take a look.

I've skipped some intermediate results since at 9 minutes to calculate it takes a while to fill in all the values above.

ECE 459 Winter 2023 30/38

Accuracy Results

GA Steps	Time (s)	Samples/s	Memory Used (MB)	Final Accuracy
1	538.37	5.56	7 069	0.621
8	501.89	5.98	7 509	0.554
32	429.70	6.98	7 509	0.347
1024	513.17	5.85	7 509	0.222

Interesting results - maybe a little concerning?

ECE 459 Winter 2023 31/38

More Isn't Always Better

Increasing the gradient accumulation does change the effective batch size...

Batch size too large may mean less ability to generalize (overfitting).

But smaller isn't always better either; can underfit the data.

In the Yelp example, I get worse accuracy with batch size of 1 than 4, and 4 is worse than 8. There really is no magic number.

ECE 459 Winter 2023 32 / 38

Gradient Checkpointing

Gradient Checkpointing: increase compute time to save memory.

Instead of saving activations, save only some, recompute the rest.

Does it work?

ECE 459 Winter 2023 33/38

Gradient Checkpointing

Trying this out with batch size of 8, the total time goes from 66.70 to 93.07s and the memory from 7 069 down to 3 619 MB.

As expected, we got slower but used less memory.

Maybe it means we can increase the batch size?

Raising it to 16 means the time was 100.55s but still only 3 731 MB

ECE 459 Winter 2023 34/38

Gradient Checkpointing

Increasing the batch size a lot to finish faster might work eventually.

And no, using this checkpointing even with a batch size of 1 is not sufficient to run the bert-large-uncased model on ecetesla0.

And remember that excessively large batch sizes aren't good...

ECE 459 Winter 2023 35/38

Mixed Precision, Data Preloading

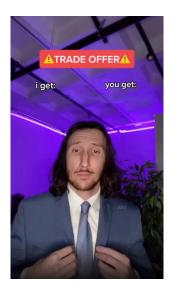

Mixed Precision: Use less accurate types (16 vs 32-bit).

Data Preloading: Multithread to get data to GPU faster.

Other ideas: Mixture of Experts, bigger GPU, multiple-GPU...

ECE 459 Winter 2023 36/38

Tradeoffs

■ Accuracy for time?

■ Memory for CPU?

Err on the side of over- or under-fitting?

ECE 459 Winter 2023 37/38

Tradeoffs

In the next few years, technologies and decision-making for this will become much more sophisticated.

But in the meantime, we can have a lot of fun experimenting and learning.

ECE 459 Winter 2023 38 / 38
