# Lecture 25 — Profiling: Observing Operations

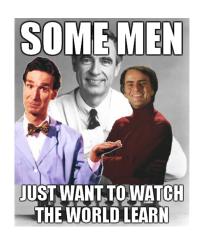

Patrick Lam & Jeff Zarnett patrick.lam@uwaterloo.ca, jzarnett@uwaterloo.ca

Department of Electrical and Computer Engineering University of Waterloo

December 8, 2022

ECE 459 Winter 2023 1/28

#### Watch and Learn

ECE 459 Winter 2023 2/28

#### Remember the Initial Quiz

Think back: what operations are fast and what operations are not?

Takeaway: our intuition is often wrong.

Not just at a macro level, but at a micro level.

You may be able to narrow down that this computation of *x* is slow, but if you examine it carefully...what parts of it are slow?

ECE 459 Winter 2023 3/28

#### **Premature Optimization**

Programmers waste enormous amounts of time thinking about, or worrying about, the speed of noncritical parts of their programs, and these attempts at efficiency actually have a strong negative impact when debugging and maintenance are considered. We should forget about small efficiencies, say about 97% of the time: premature optimization is the root of all evil. Yet we should not pass up our opportunities in that critical 3%.

Donald Knuth

ECE 459 Winter 2023 4/28

# That Saying You Were Expecting

Feeling lucky? Maybe you optimized a slow part.

To make your programs or systems fast, you need to find out what is currently slow and improve it (duh!).

Up until now, it's mostly been about "let's speed this up".
We haven't taken much time to decide what we should speed up.

ECE 459 Winter 2023 5/28

# Why Observation?

Observation is a bit more than just measuring things.

ECE 459 Winter 2023 6/28

#### **Kinds of Observation**

- 1 Counters
- 2 Profiles
- 3 Traces

We'll return to profiling later on.

ECE 459 Winter 2023 7/28

# **Tracing: Logging**

Logging is an effective way of finding out what's happening.

We have surely all used printf to debug!

 $Logs\ need: time stamp, message, \&\ attributes.$ 

ECE 459 Winter 2023 8/28

# Logging

If we get only one tool – logging!

How often to log, and what content?

This may be our only shot to get that info... But don't drown out relevant things!

ECE 459 Winter 2023 9/28

#### Ideas

Log input and output?

Want to be able to link things...

ECE 459 Winter 2023 10 / 28

#### Example

Received request: update plan of company 12345 to ULTIMATE
Retrieving company 12345
Verifying eligibility for upgrade of company 12345 from BASIC to ULTIMATE
Company 12345 is not eligible for upgrade due to: unpaid invoices > 0
Returning response: update of company 12345 to ULTIMATE is DECLINED

ECE 459 Winter 2023 11/28

#### **Timestamp Precision**

Timestamp precision depends on the timescale of execution.

Time zones matter. Recommendation: UTC!

Or Stardates?

ECE 459 Winter 2023 12/28

#### Too Much Noise

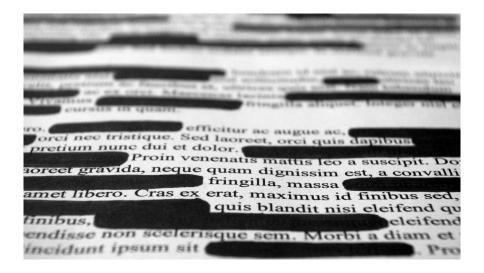

Logging every request might be too noisy.

Searching and sorting help!

Too much detail is also bad...

ECE 459 Winter 2023 13/28

## Personally Identifiable Information = No

ECE 459 Winter 2023 14/28

# Over-logging

Is it too hard to get access to info other ways?

Aim for a balance.

ECE 459 Winter 2023 15/28

# Overhead of Tracing

CPU trace tool: 20× slowdown.

Timestamp at function call:  $1.2 - 1.5 \times$  slowdown.

Timestamp of system call entry/exit: < 1%

ECE 459 Winter 2023 16/28

# Other Overhead Tracing

Valgrind: Up to  $100 \times$  slowdown.

Disk trace: pretty minimal!

Can identify deadlocks and waiting for locks.

ECE 459 Winter 2023 17/28

## Space, the Final Frontier

Image Credit: Revma Mahita

The trace itself takes up space.

20 GB/s bandwidth and 64-byte cache lines recording up to 8 bytes of data per trace entry could result in producing data at a rate of 2.4 GB per second.

ECE 459 Winter 2023 18/28

#### Counters

Counters, as the name suggests, keep a count of events: interrupts, cache misses, data bytes written, calls to function do\_magic().

Counters are aggregation, because we're summing the number of occurrences.

ECE 459 Winter 2023 19 / 28

## Other Aggregation

Average response time is aggregation: total time and number of requests.

Asking the computer to calculate the summary is sensible.

Ideas: number of requests, requests broken down by type, average time to respond to a request, percentage of error responses...

ECE 459 Winter 2023 20 / 28

## Context is Key

ECE 459 Winter 2023 21/28

# Context to Aggregation

After my PR, login time 0.75s - Good or bad?

Depends on the baseline. Maybe it was 0.5s?

Okay, increased – is that bad?

ECE 459 Winter 2023 22 / 28

# **Another Example**

Request takes on average 1.27s - Good or Bad?

What if the time limit is 1 second? 10 seconds?

How hard is the deadline?

ECE 459 Winter 2023 23 / 28

# **Averages Misleading**

All of these are 7 requests per second on average:

0000000	0000000	0000000	0000000	0000000
000000000	000000000	000000000	00000	
	00000000	000000 0000 0	00	0 000 0

ECE 459 Winter 2023 24 / 28

#### **Time Period**

When we aggregate, we have to choose the period of time.

Whole execution of the task?

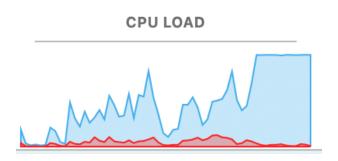

Indefinitely-running services?

We might miss important things!

ECE 459 Winter 2023 25/28

## Look at the Pretty Pictures

Graphs and visualizations help us see trends in data.

Managers and non-techies love them!

If we put together enough pretty pictures, we get a dashboard.

ECE 459 Winter 2023 26 / 28

Dashboards are ideally more than just pretty pictures of LINE GOES UP.

Should present an easily-digestible summary.

#### **Drill Down**

This is just a high level idea of identifying what's happening.

As we proceed we need to get to lower level tools.

Next: narrowing down where the bottleneck is.

ECE 459 Winter 2023 28 / 28
