Lecture 27 — Memory Profiling

Jeff Zarnett
jzarnett@uwaterloo.ca

Department of Electrical and Computer Engineering
University of Waterloo

January 4, 2019

So far: CPU profiling.

Memory profiling is also a thing;
    specifically heap profiling.

"Still Reachable": not freed & still have pointers,
    but should have been freed?

As with queueing theory:

$$\text{allocs} > \text{frees} \implies \text{usage} \to \infty$$

At least more paging, maybe total out-of-memory.

But! Memory isn't really lost: we could free it.

Our tool for this comes from the Valgrind tool suite.

What does Massif do?

- How much heap memory is your program using?
- How did this happen?

Next up: example from Massif docs.

```c
#include <stdlib.h>

void g ( void ) {
    malloc( 4000 );
}

void f ( void ) {
    malloc( 2000 );
    g();
}

int main ( void ) {
    int i;
    int* a[10];

    for ( i = 0; i < 10; i++ ) {
        a[i] = malloc( 1000 );
    }
    f();
    g();

    for ( i = 0; i < 10; i++ ) {
        free( a[i] );
    }
    return 0;
}
```

After we compile (remember - g for debug symbols), run the command:

```
jz@Loki:~/ece459$ valgrind --tool=massif ./massif
==25187== Massif, a heap profiler
==25187== Copyright (C) 2003-2013, and GNU GPL'd, by Nicholas Nethercote
==25187== Using Valgrind-3.10.1 and LibVEX; rerun with -h for copyright info
==25187== Command: ./massif
==25187==
==25187==
```

What happened?

1. The program ran slowly (because Valgrind!)
2. No summary data on the console
   (like memcheck or helgrind or cachegrind.)

Weird. What we got instead was the file
`massif.out.[PID]`.

`massif.out.[PID]:`
        plain text, sort of readable.

Better: `ms_print`.

Which has nothing whatsoever to do with Microsoft. Promise.

```

  19.71^                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                      #
       |                                                     :#
       |                                                     :#
       |                                                     :#
       |                                                     :#
     0 +-------------------------------------------------->ki
       0                                                  111.9
```
For a long time, nothing happens, then...kaboom!

Why? We gave it a trivial program.

We should tell Massif to care more about bytes than CPU cycles, with `--time-unit=B`.

Let's try that.

```
   KB
19.71^                                          ### <- peak

     |   ::: : : : : :  : @  :  :          :     #  : :   : : :   : : : : @
    0 +------------------------------------------------------------------>KB
      0                                                          29.63
```

OK! Massif took 25 snapshots.

- whenever there are appropriate allocation and deallocation statements, up to a configurable maximum.

Long running program:
will toss some old data if necessary.

```
-----------------------------------------------------------------------
  n        time(B)          total(B)   useful-heap(B) extra-heap(B)   stacks(B)
-----------------------------------------------------------------------
  0              0                 0                0             0           0
  1          1,016             1,016            1,000            16           0
  2          2,032             2,032            2,000            32           0
  3          3,048             3,048            3,000            48           0
  4          4,064             4,064            4,000            64           0
  5          5,080             5,080            5,000            80           0
  6          6,096             6,096            6,000            96           0
  7          7,112             7,112            7,000           112           0
  8          8,128             8,128            8,000           128           0
```

time(B) column = time measured in allocations
(our choice of time unit on cmdline).

extra-heap(B) = internal fragmentation.

(Why are stacks all shown as 0?)

```
--------------------------------------------------------------------
  n         time(B)         total(B)    useful-heap(B) extra-heap(B)    stacks(B)
--------------------------------------------------------------------
  9           9,144           9,144          9,000          144             0
98.43% (9,000B) (heap allocation functions) malloc/new/new[], --alloc-fns, etc.
->98.43% (9,000B) 0x4005BB: main (massif.c:17)
```

Now: where did heap allocations take place?

So far, all the allocations took place on line 17,
which was a[i] = malloc(1000);
inside that for loop.

```
--------------------------------------------------------------------------------
  n         time(B)          total(B)    useful-heap(B) extra-heap(B)    stacks(B)
--------------------------------------------------------------------------------
 14         20,184           20,184          20,000          184             0
99.09% (20,000B) (heap allocation functions) malloc/new/new[], --alloc-fns, etc.
->49.54% (10,000B) 0x4005BB: main (massif.c:17)
|
->39.64% (8,000B) 0x400589: g (massif.c:4)
| ->19.82% (4,000B) 0x40059E: f (massif.c:9)
| | ->19.82% (4,000B) 0x4005D7: main (massif.c:20)
| |
| ->19.82% (4,000B) 0x4005DC: main (massif.c:22)
|
->09.91% (2,000B) 0x400599: f (massif.c:8)
  ->09.91% (2,000B) 0x4005D7: main (massif.c:20)
```

Massif found all allocations and
distilled them to a tree structure.

We see not just where the `malloc` call happened,
but also how we got there.

Termination gives a final output of what blocks remains allocated and where they come from.

These point to memory leaks, incidentally, and Memcheck would not be amused.

```
 24        30,344          10,024          10,000          24          0
99.76% (10,000B) (heap allocation functions) malloc/new/new[], --alloc-fns, etc.
->79.81% (8,000B) 0x400589: g (massif.c:4)
| ->39.90% (4,000B) 0x40059E: f (massif.c:9)
| | ->39.90% (4,000B) 0x4005D7: main (massif.c:20)
| |
| ->39.90% (4,000B) 0x4005DC: main (massif.c:22)
|
->19.95% (2,000B) 0x400599: f (massif.c:8)
| ->19.95% (2,000B) 0x4005D7: main (massif.c:20)
|
->00.00% (0B) in 1+ places, all below ms_print's threshold (01.00%)
```

Here's what Memcheck thinks:

```
jz@Loki:~/ece459$ valgrind ./massif

```

Run valgrind (Memcheck) first and make it happy before we go into figuring out where heap blocks are going with Massif.

Okay, what to do with the information from Massif, anyway?

Easy!

- Start with peak (worst case scenario) and see where that takes you (if anywhere).
- You can probably identify some cases where memory is hanging around unnecessarily.

Memory usage climbing over a long period of time, perhaps slowly, but never decreasing—memory filling with junk?

Large spikes in the graph—why so much allocation and deallocation in a short period?

- stack allocation (`--stacks=yes`).
- children of a process
  (anything split off with `fork`) if desired.
- low level stuff: if going beyond `malloc`, `calloc`,
  new, etc. and using `mmap` or `brk` that is usually
  missed, can do profiling at page level
  (`--pages-as-heap=yes`).

As is often the case,
we have examined the tool on a trivial program.

Let's see if we can do some
live demos of Massif at work.
